AB	The invention concerns trilayered textiles for surgical covers and clothing that are composed of a silicon elastomer middle layer and polyester outer layers . The outer layers are non-woven textiles and they are non-absorbing. One of the outer layers can be hydrophilized. The layers are laminated by vulcanization; no adhesives are used.

AB The tarpaulins are prepd. by coating two sides of **woven fabrics** of high-tenacity polyester fibers having no. warp yarns per in. 50-20 and no. of filling yarns 5-20 with blends contg. 15-94.5% LLDPE or LDPE, 5-60% ethylene- α -olefin copolymer **elastomers**, 0.5-15% masterbatch contg. LLDPE or LDPE and pigments or TiO₂, and 0-10% adhesion-preventing masterbatch contg. LLDPE or LDPE and **silica** or CaCO₃. A **woven polyester fabric** was coated on two sides with a blend contg. LLDPE 70, ethylene-butene copolymer rubber 20, masterbatch contg. 85% LLDPE and 15% TiO₂ 5, and masterbatch contg. 95% LLDPE and 5% **silica** by the extrusion method and calendered at roll temp. 30.degree. to give a coated tarpaulin with tensile strength 23.4 kg, tearing strength 10.2 kg, and coating **layer** adhesive strength 14.1 kg/cm.

AB The sheet material comprises a **layer** of **silicone** rubber which may be foamed, and a .ltoreq.1-.mu.m-thick metallic foil (esp. Al) bonded to one surface of the **elastomer** by transferring the foil from a supporting substrate. The **elastomer** can be supported on a knitted, braided, or **woven fabric** support. Protective tubing (e.g., for wiring, fuel lines, brake lines) and clothing can be made from the flexible material.

PI DE 3628187 C1 19880204 DE 1986-3628187 19860820
PRAI DE 1986-3628187 19860820

AB In the title filters for particles with .ltoreq.100.mu. diam., and comprising a fibrous support and a filtering **layer** with hollow spaces, some of which are formed at the support-filter **layer** interface, the filter **layer** is placed with one side facing the support and is surrounded by a 3-dimensional **woven silicone elastomer layer** with multiple labyrinthian pores. The **silicone elastomer layer** may be made of linear dialkylpolysiloxanes **woven** with reactive polysiloxanes. The filtering material may be a flame-retardant and/or elec. conductive material and the filter **layer** may be 0.01-1 mm thick. The support surface may be made of high temp.-resistant aramid, C, and/or graphite fibers. The filter is prepd. by scorching a surface of the support, fixing it by a 1st heating stage, applying a filtering material mixt. contg. a non-3-dimensional **woven** polymeric siloxane, a cross-linking catalyst, and a cross-linking agent, and cross-linking by a 2nd heat treatment. A mixt. contg. high mol. wt. liq. dimethylpolysiloxan 100, org. Pt complex 0.4, reactive polysiloxane 3.5, decabromodiphenyl oxide 17.5, Sb2O3 17.5, and water 10 wt. parts was applied at 250 g/m2 to a singed and fixed aramid fiber **fabric** with surface wt. 300 g/m2, the coated **fabric** was dried at 130.degree. for 45 s, and the cross-linked to a 3-dimensional structure at 170.degree. for 45 s. The filter, with air permeability 140 L/dm3, was not damaged after 10,000 h in a gas stream of .apprx.230.degree. and the filtering material did not sep. from the support. The filters gave higher removals of particles or dust than conventional filters but very little of the particles remained in the labyrinthian pores.

TI Flock coating porous fabrics

IN Grundman, Roger V.

PA Minnesota Mining and Manufg. Co.
SO U.S., 4 pp.
CODEN: USXXAM
DT Patent
LA English
FAN.CNT 1

	PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
PI	US 3436245	A	19690401	US 1965-506652	19651108
PRAI	US 1965-506652		19651108		

AB Flock-coated substrates were prepd. by coating the individual fibers of an open **fabric** substrate with a pressure-sensitive adhesive without closing the openings of the substrate, applying a fibrous flock coating to the substrate, applying a settable liq. adhesive (such as a 2-part polyurethane) to the side of the substrate opposite the flock coating, passing the adhesive through the openings in the substrate to embed the substrate and the ends of the fibers attached, and curing the adhesive. The method applies the flock fibers to the **fabric** substrate in colored patterns, that are useful as floor coverings. Thus, an open **woven** cotton scrim was coated on 1 side with a pressure-sensitive adhesive contg. 94.5 parts isooctyl acrylate and 5.5 parts acrylic acid as .apprx.10% solids in heptane. A stencil (as an endless belt formed from a 6 mm.-thick **layer** of polyurethane **elastomeric** foam laminated to an open netting) was pressed over the adhesive-coated surface of the scrim. White nylon staple fibers (53 denier), length 4.5 mm. were coated through the openings in the stencil onto the adhesive-coated scrim while vibrating the scrim with a vibrating platen. A thin **layer** of detergent foam was applied over the fibers and the stencil was removed. Blue nylon staple fibers (45 denier), length .apprx.4 mm. were applied while vibrating the scrim with a vibrating platen to the portions of the scrim previously covered by the stencil. An endless **silicone** rubber-satd. glass cloth belt was used as a casting surface for the 2-part polyurethane compn. The 1st part (A) contained polypropylene ether glycol (I) (mol. wt. 200) 356, PbO 1.2, **silica** 16, 4,4'-methylenebis(2-chloroaniline) 21.6, Ca 2-ethylhexanoate 1.2, PhHgOAc 2.4, and 2,6-di-tert-butyl-4-methylphenol 1.6 parts. The 2nd part (B) contained tolylene diisocyanate 62.3, I (mol. wt. 400) 31.4, and polypropylene ether triol (mol. wt. 400) 6.3 parts. The compn. was continuously mixed in a ratio of 3.77 parts for part A for each part B and knife-coated onto the belt to a 1 mm. thickness. The flock-coated scrim was pulled down into the liq. reaction mixt. to sat. the scrim and the lower ends of the flock fibers. The satd. scrim was passed over a drum heated to .apprx.100.degree. and reacted to give a solid noncellular **elastomer**.
